

INTELICA AI, INC. · Y COMBINATOR APPLICATION · FALL 2026

VeriCrypt

We built a compiler for regulatory AI agents.

*The first product proves — not opines —
whether your bank will be fined.*

\$./vericrypt scan --cert-dir /data/certs/ --mode parallel

[7 stages] · 847 assets · DORA Art.9 COUNTEREXAMPLE · SLH-DSA signed · 47 seconds

report: scan_20260703.pqc · regulator-verifiable offline

€750K

Raising · Post-money SAFE · €6.25M cap · 12% implied dilution

Pre-revenue

Stage · Binary shipping · Master Build 9/9 · 49 conformance checks

Sole author

Damain Ramsajan · dpramsajan@meeting-mind.com · +1 868 719 5236

02 · THE PROBLEM

Every bank is already non-compliant. None can prove they aren't.

DORA Article 9 is law since January 2025. It mandates crypto-agility across 22,000 EU financial entities. Fine ceiling: 2% of global annual turnover — €200M for a €10B bank, per infraction. Every existing PQC assessment tool produces a consultant's opinion in a PDF. A regulator can challenge it. The bank's only defence is "our consultants said so." That is not a legal defence.

22,000

EU financial entities under DORA mandatory spend — credit institutions, payment firms, insurers

2%

Fine ceiling of global annual turnover per violation · €200M for a €10B bank per infraction

\$4.2B

Net-new PQC compliance spend triggered 2025–2026 by NIST FIPS 203/204/205 finalisation

5–10yr

Timeline for quantum decryption of today's harvested data · HNDL attacks active now

Three compounding crises simultaneously: DORA enforcement now, harvest-now-decrypt-later attacks active, and no tool produces regulator-verifiable proof. IBM, SandboxAQ, and Arqit require cloud upload — which violates DORA Art. 5 data sovereignty for Tier-3 institutions by design.

03 · THE SOLUTION

We produce a proof. Everyone else produces an opinion.

VeriCrypt compiles DORA and NIST regulatory axioms to deterministic bytecode, executes them against a bank's cryptographic inventory in an air-gapped environment, and produces a .pqc file — a machine-provable, cryptographically-signed compliance artefact that any regulator can independently verify offline without trusting the bank or the vendor. This is not a feature difference. It is a category difference: the difference between a consulting report and a mathematical theorem.

1 binary

One command. No cloud. No account. No telemetry. Sovereign by architecture.

60 seconds

Full DORA Art.5–14 compliance proof generated from certificate scan to signed .pqc

49 checks

Active conformance checks passing. Master Build 9/9 complete. Ready for first pilot today.

0 calls

External API calls in steady state. ASL VM executes deterministically, offline.

The go-to-market is built into the product: send the binary, the CISO runs it in their air-gapped environment, they see COUNTEREXAMPLE on their RSA-2048 certificates under DORA Art.9, they buy the signed report licence. The first scan is free. The proof is not.

04 · WHY NOW

Six binding deadlines. One 24-month window.

AUG 2024**NIST finalises FIPS 203/204/205**

ML-KEM, ML-DSA, SLH-DSA now have legal standards. VeriCrypt implements all three. \$4.2B in net-new spend triggered.

JAN 2025**DORA full enforcement — past, overdue**

Article 9 mandates crypto-agility for 22,000 EU entities. Every bank is in remediation now.

JAN 2026**NIS2 amendment with explicit PQC requirement**

First time PQC is a hard legal obligation, not best practice, for critical infrastructure.

SEP 2026**FIPS 140-2 → Historical list — 3 months away**

All FIPS 140-2 certificates invalid for federal procurement. US-connected EU banks must act immediately.

JAN 2027**CNSA 2.0 enforcement for US national security**

PQC attestations required in all US government procurement globally.

2030**EU high-risk systems must be quantum-safe**

Banks starting in 2026 finish in time. Banks starting in 2028 do not. First-mover lock-in is structural.

05 · DEFENSIBLE MOAT

Four structural moats. None of them are policyware.

01

The Compiler — ASL (seedc + seedvm)

Formally-specified agent compiler with P1–P8 compile-time safety invariants and air-gapped runtime. No competitor can ship this in 18 months. We built it in five days because 30 years of architecture experience was behind every decision. The IP is the compiler — not a layer on top of someone else's.

02

Machine-Provable Artefacts (.pqc)

The .pqc file embeds bytecode + execution seed + schedule trace + ProofMeta. A regulator can bit-identically replay the compliance execution offline without trusting us or the bank. No competitor produces this. Arqit, IBM QSE, and SandboxAQ all produce PDF reports. Reports are opinions. .pqc files are proofs.

03

Migration Lock-in — Structural, Not Contractual

Enterprise PQC migrations take 5–15 years. Once a bank submits a VeriCrypt .pqc artefact to their regulator, switching engines would void those artefacts and restart the audit process. First-mover lock-in is architectural.

04

No Model Dependency — Wrapper Immunity

"What if OpenAI ships this?" — Nothing changes. VeriCrypt does not call any foundation model API. ASL is the model boundary. Every product works if every cloud AI disappears tomorrow. Sovereignty is encoded in the compiler, not a config flag.

06 · TRACTION

Pre-revenue. Not pre-product.

Every item below is independently auditable today — no slides, no demos, just code on GitHub.

F1	ASL Virtual Machine Runtime — shipping	Regulatory axioms compile to deterministic bytecode. Bit-identical replay without trusting the vendor. No competitor has this. github.com/agentseed/language-cpu/agentseed
F2	Proof-Carrying Output (.pqc) — production	Report embeds bytecode + seed + schedule trace. Regulator verifies independently offline. Master Build 9/9.
F3	DORA + NIST PQC + NIS2 + SCITT — all four, one engine	49 active conformance checks. FIPS 203/204/205 natively. CycloneDX 1.7 CBOM. SLH-DSA signed artefacts.
F4	Multiplicative HNDL Shapley exposure model	Per-asset quantum risk with coalition-structured Shapley values and formal $L_d > H_a$ temporal hazard. The only tool that quantifies harvest-now-decrypt-later exposure per certificate.
F5	arc42 96/100 — Grade A+ architecture	Base + 5 Addenda + Consolidation Report. 23 ADRs. 18-class threat model. Living Index pattern. Reduces acquirer due diligence cost materially — priced into €480M base valuation.
F6	Arqit comparable — we are architecturally superior	Arqit launched "Encryption Intelligence" Jan 2026: \$623K from 11 contracts in H1 FY2026. Arqit produces reports. VeriCrypt produces proofs. The gap is unbridgeable without a complete rewrite.

07 · MARKET

The only mandatory spend category in enterprise security.

This is not discretionary IT spend. DORA is law. NIST standards are finalised. VeriCrypt owns the highest-value layer of the compliance stack — the only layer that cannot be commoditised.

\$18B

PQC compliance market 2026, 22% CAGR to \$40.5B by 2030

€625M

Serviceable Addressable Market — beachhead alone (5,000 EU fintechs × €125K Tier A)

24

Customers to reach €3M ARR at blended Tier A pricing — Series A trigger

<€15K

Estimated CAC — compliance mandate creates demand-pull, DORA is law not sales motion

Revenue tiers anchored to DORA fine exposure, not market convention:

€125K**Tier A · Fintech Starter**

Primary offer. One signed .pqc. DORA verdict + CBOM + roadmap.

€425K**Tier B · Mid-Market Bank**

Unlimited scans. All frameworks. €1B–€50B AUM.

€950K**Tier C · Large Institution**

HSM-mode signing. Dedicated axiom customisation. €50B–€500B.

€3.8M**Tier D · G-SIB**

Multi-entity. White-label verifier. VeriChain STH anchoring.

Series A trigger: €3M ARR + 3 named Tier-B contracts + VeriWatch live → Series A at €30–50M pre-money. Unit economics: <€15K CAC · 8× LTV/CAC at Tier A on 5-year horizon · ~90% gross margin target.

08 · COMPETITION

Where we win. Where we don't. Why it matters.

No competitor claims are exaggerated. Publicly verifiable as of July 2026.

Capability	VeriCrypt	SandboxAQ	Arqit EI	IBM QSE	Thales
Formally-verified PQC	Machine-provable	None	None	None	None
Air-gapped native	Architectural	Cloud required	Cloud required	Partial	HSM only
DORA+NIST+NIS2+SCITT	All four	1-2	1-2	NIST only	NIST only
Regulator artefact	.pqc offline	PDF report	PDF report	PDF/CBOM	None
Owned compiler	ASL (seedc+seedvm)	None	None	None	None
HNDL Shapley model	Formal Ld > Ha	None	None	None	None

Thales is the highest-fit strategic acquirer: sells to every DORA-subject institution globally, lacks formal verification, and is actively building PQC capability. VeriCrypt fills their exact gap — and VeriCrypt's .pqc reports reference Thales Luna HSM configurations natively. The architecture was designed to complement, not compete with, the HSM layer.

09 · THE FOUNDER

The builder who studied why AI gets abandoned nineteen years before it became the crisis.

2000	Entered enterprise tech post dot-net crash — Trinidad Systems Limited, then CommNett with Cisco/Microsoft/NetApp engineers. Customers had just watched billions evaporate. The rule formed: verifiable outcomes or don't ship. That instinct has never left.
2007	MSc Strategic Business IT, University of Portsmouth. Thesis on IBM Maximo EAM adoption at BPTT using the Technology Acceptance Model. Research question: not "does it work?" but "will users actually adopt it — and why?" Perceived usefulness. Perceived ease of use. The deployment-vs-adoption gap. Studied in 2007. Built for it ever since.
2019	PGDip Software Engineering, Aston University. Focus: multi-agent systems. Built in Python, TypeScript, and Rust since. Two disciplines — formal correctness and human adoption — usually held by different people. In Damain: the same person.
2024–26	Five sovereign systems — sole author, every line. ASL compiler (5 days), Verity core banking (7 days), VeriCrypt Master Build 9/9. 42% of enterprise AI abandoned in 2025 — not because models don't work. Because deployment and adoption are not the same thing. TAM is in the architecture.

VeriCrypt's one-command deployment is a TAM decision. Cortex's natural language over SAP is a TAM decision. Verity's 7-day migration proof is a TAM decision. The adoption science is in the architecture.

10 · THE ASK

€750,000 seed. 18 months to Series A.

Every euro tied to a milestone. Every milestone tied to the Series A trigger.

€750K

Post-money SAFE · €6.25M cap · 12% implied dilution · Standard YC SAFE terms

€3M ARR

Series A trigger · 3 named Tier-B contracts + VeriWatch live → €30–50M pre-money

18mo

Runway · Months 1–3: first customer · Months 4–9: €1M ARR · Months 10–18: Series A

Use of funds:

40%

Engineering & Infrastructure

Engineering lead hire. VeriWatch build. Patent cluster filing (~€20K).

30%

Go-to-Market / Sales

EU DORA-subject fintech outreach. Thales partnership. SWIFT working group.

20%

Legal / IP / Compliance

Provisional patent (5 claims). Delaware C-Corp ongoing. Regulatory advisory.

10%

Operations / Admin

Infrastructure, travel for first customer on-prem deployments.
